Nitroalkanes In Mainstream Smoke(MSS)

- Nitroalkanes were detected from MSS by Hoffmann and Rathkamp in 1968.

- Among of these nitroalkanes, **nitromethane** and **2-nitro-propane** are IARC Group 2B carcinogens.

Multidimensional chromatography

- Hoffmann's method includes one steam distillation and two Liquid-Liquid extraction steps for sample preparation. It's some labourious.
- **Multidimensional chromatography** using columns in series with different stationary phases have shown much **greater separating power** than normal chromatography.
- With multidimensional chromatography ,one can obtain better results while **simplify the sample preparation**. It has been used in the analysis of complex sample, such as petrol, flavor.

- Here, we fabricated a heart-cut two-dimensional GC/MS (GC-GC/MS) system, and with which, a method for analysis of nitroalkanes in MSS was developed.

Scheme of the GC-GC/MS system

The **cold trap** was used to cryofocus and remobilize the “cuts”.

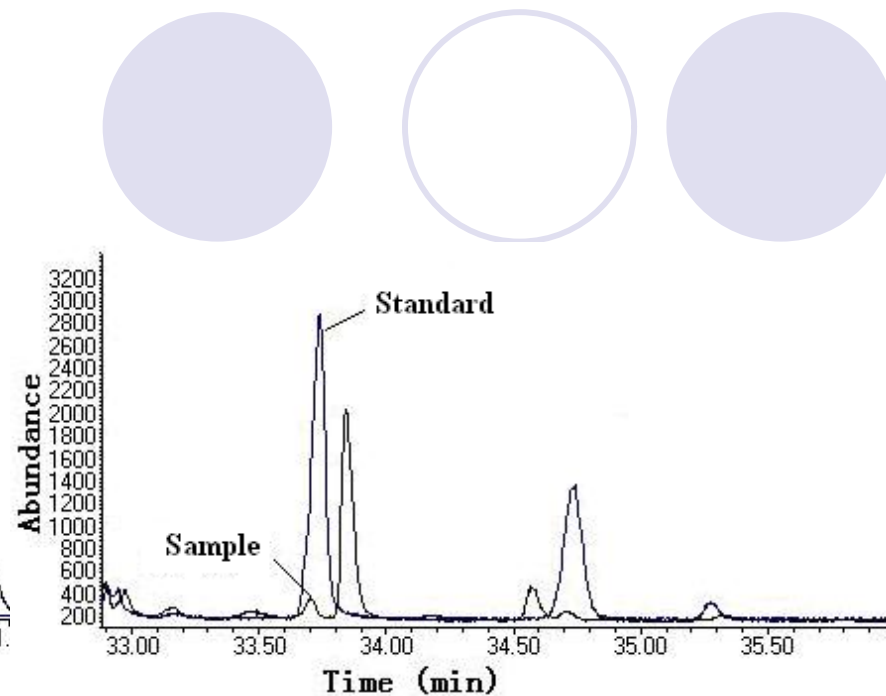

Structure of the cold trap

A programmed temperature vaporization (PTV) inlet was reconstructed as the cold trap. The cuts from 1st GC was focused in capillary column.

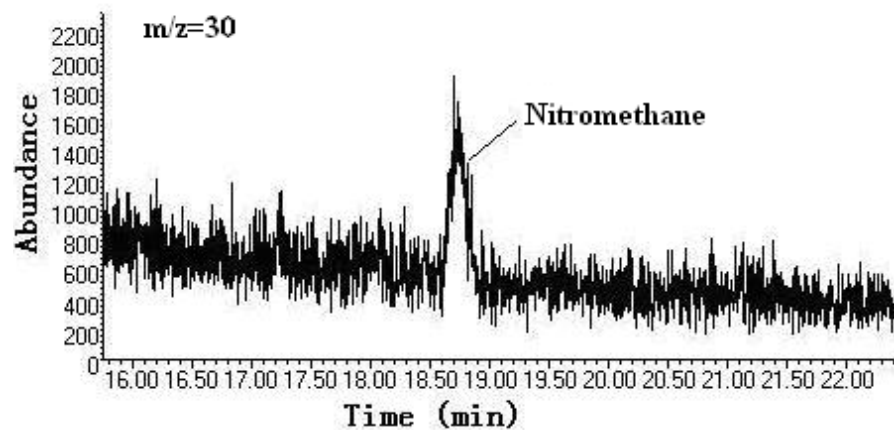

1D GC/MS chromatograph of nitroethane standard and smoke sample.

2D GC/MS chromatograph of nitroethane standard and smoke sample.

GC-GC/MS has **better resolution ability** than 1D GC/MS.

1D GC/MS chromatograph of smoke sample

2D GC/MS chromatograph of smoke sample.

GC-GC/MS gets **better S/N** than 1D GC/MS.

Sample preparation for MSS

- **Gaseous matter** : trapped by ethyl acetate in dry Ice-isopropyl alcohol .
- **Particulate matter** : the particulate matter on cambridge filter was extracted by ethyl acetate.
- 2-Methyl-2-nitropropane was used as **Internal standard**.

Main chromatography condition

- **Column:**

HP-INNOWAX (1st column) + DB-17 (2nd column) .

- **Carrier gas flow:**

1st : 1mL/min ; 2nd : 2mL/min.

- **Temperature programme:**

1st GC : 50°C (5min) $\xrightarrow{2^\circ\text{C}/\text{min}}$ 140°C $\xrightarrow{30^\circ\text{C}/\text{min}}$ 170°C (5 min)

2nd GC : 40°C (36min) $\xrightarrow{2^\circ\text{C}/\text{min}}$ 70°C $\xrightarrow{30^\circ\text{C}/\text{min}}$ 230°C (10min)

Cold trap : 50°C (4min) $\xrightarrow{100^\circ\text{C}/\text{min}}$ -140°C (25min) $\xrightarrow{700^\circ\text{C}/\text{min}}$ 250°C (2 min)

Retention time and heart-cut time of nitroalkanes

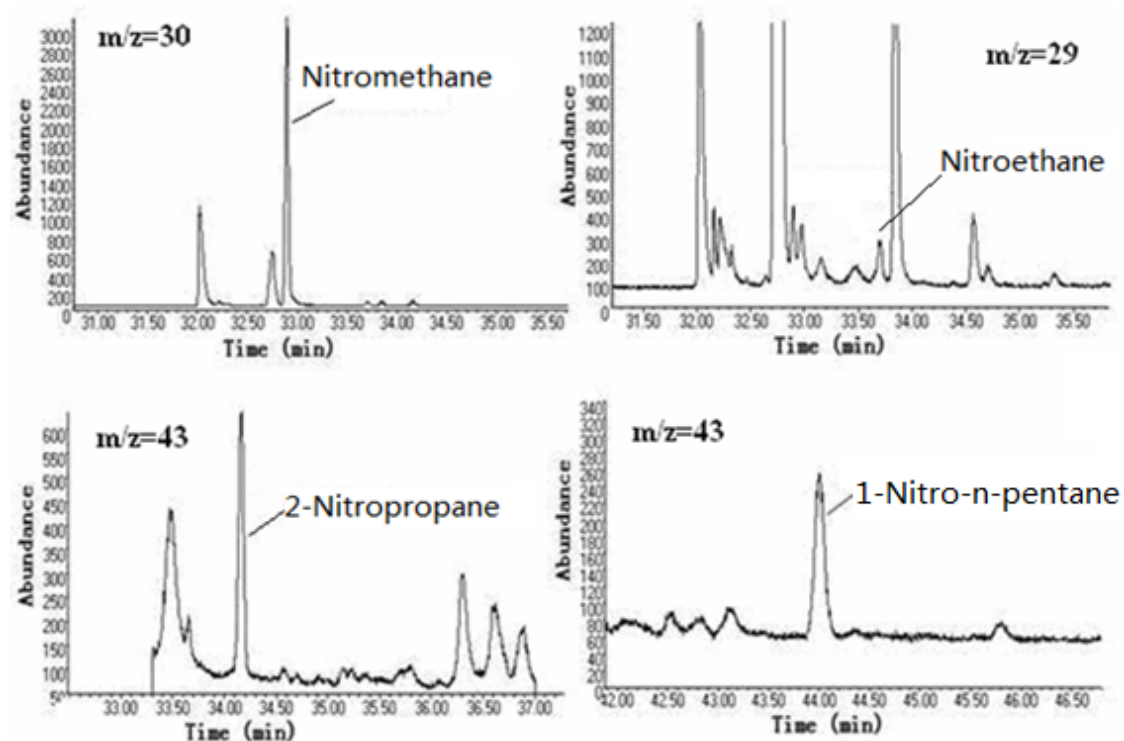

Compounds	1D R.T. (min)	Heart-cut time (min)
2-Methyl-2-nitropropane (Internal standard)	11.64	11.45~11.85
Nitromethane	14.01	13.80~14.70
Nitroethane	14.43	13.80~14.70
2-Nitropropane	12.46	12.20~12.70
1-Nitropropane	17.08	16.80~17.40
1-Nitro-n-butane	22.07	21.80~22.40
1-Nitro-n-pentane	28.27	28.00~28.50

1D chromatograph of MSS particulate sample after heart-cut

Six cuts were executed in one injection.

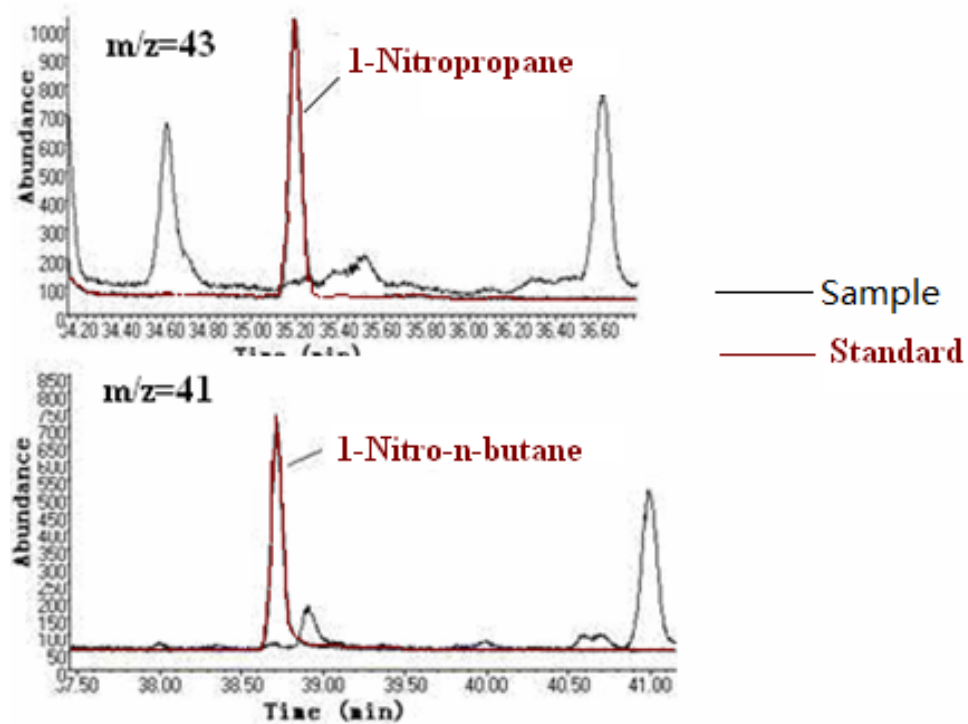

Qualitative analysis of nitroalkanes in MSS

Extracted ion chromatographs of MSS sample

After comparing with the mass spectrum of standards, nitromethane, nitroethane, 2-nitropropane and 1-nitro-n-butane was identified from MSS.

Qualitative analysis of nitroalkanes in MSS

Extracted ion chromatographs of MSS sample and nitroalkane standards.

1-Nitropropane and 1-nitro-n-butane was **not detected from MSS.**

Evaluation of quantification method

- LOD:**

Range from 1.30 ng/cig (for nitromethane) to 9.80 ng/cig (1-nitro-n-butane)。

- RSD (n=7)**

	Nitromethane	Nitroethane	2-Nitropropane	1-Nitro-n-pentane
Average ($\mu\text{g}/\text{cig}$)	2.67	0.150	0.660	0.180
RSD (%)	7.17	9.43	7.31	8.25

- Recovery(%)**

Add level						
	Nitromethane	Nitroethane	1-Nitropropane	2-Nitropropane	1-Nitro-n-butane	1-Nitro-n-pentane
Low	109	110	97.6	90.3	94.0	95.0
High	104	101	104	90.2	98.2	87.1

Yields of nitroalkanes in MSS of different cigarettes

Compounds	Yields range ($\mu\text{g}/\text{cig}$)
Nitromethane	0.12–1.61
Nitroethane	0.07–0.16
2-Nitropropane	0.17–1.49
1-Nitro-n-pentane	0.12–0.26

Note: 13 brands of cigarettes were tested, including 7 blend and 6 virginia cigarettes.

Thank you for your attention!
